NOTE

If you cannot find answers to your questions in any of the documentation, contact INFINITT Technical Support. Please include any relevant logs, usage descriptions, or other data that may be helpful in diagnosing the problem in your submission.

1 Introduction

This conformance statement (CS) specifies the compliance of INFINITT Network Gateway to DICOM. It details the DICOM Service Classes and the roles that are supported by this product.

2 DICOM Conformance Statement

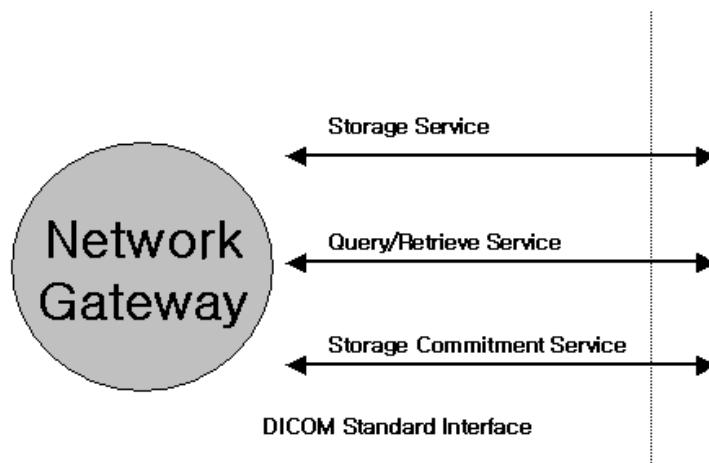

Network Gateway is DICOM Gateway running on Microsoft Windows NT/2000 or over. Network Gateway uses DICOM services to store and query/retrieve images to and/or from other DICOM applications.

Note that the format for this article strictly follows that of the DICOM Standard Part 4 (Service Class Specifications) Annex K and DICOM Standard Part 2 (Conformance) Annex A. Thus, it is advised for the reader to refer to those parts of the standard while reading this article.

2.1 Implementation Model

2.1.1 Application Data Flow Diagram

The basic and specific application models for the Network Gateway and Worklist Gateway are shown in the following figure.

Network Gateway uses DICOM protocol to send and query/retrieve images from/to other DICOM applications.

Network Gateway Administrator is used to configure all the configurations for Network Gateway. Also INFINITT RIS/Administrator is used to configure remote DICOM applications.

The Network Gateway is always waiting for request from users.

2.1.2 Fundamental Definition of AE's

Network Gateway supports the following functions:

- Response to DICOM associations to receive images from remote hosts
- Response to DICOM associations to query/retrieve images from remote hosts
- Storage of DICOM Part 10 format files into the storage device
- Response to DICOM associations to handle Storage Commitment request from remote hosts and send Storage Commitment results back
- Sending of Storage Commitment results to remote hosts

2.1.3 Sequencing of Real-World Activities

Table 2-2: SOP Classes Supported as an SCP (Network Gateway)

2.2.1.1 Association Establishment Policies

2.2.1.1.1 General

Before any SOP Classes are interchanged between Network Gateway and other DICOM applications, an association stage takes place to negotiate and exchange the capabilities of the SCU and SCP. Network Gateway and other DICOM application establish an association by using the Association Services of the DICOM Upper Layer. During association establishment stage, Network Gateway negotiates the supported SOP classes.

The DICOM Application Context Name (ACN), which is always proposed, is:

Application Context Name	1.2.840.10008.3.1.1.1
--------------------------	-----------------------

The Maximum Length PDU negotiation is included in all association establishment requests. However, the Maximum Length PDU for an association cannot be greater than:

Maximum Length PDU	64234 bytes
--------------------	-------------

The SOP Class Extended Negotiation is not supported. The user information items sent by this application are:

- Maximum PDU Length
- Implementation UID

2.2.1.1.2 Number of Associations

The number of supported associations depend on the SCU/SCP role of Network Gateway.

The number of associations as an SCU varies from 0 (on idle) to as many as the number of the retrieve request. So Network Gateway can make multiple associations when transferring images to multiple DICOM applications.

The number of associations as an SCP is virtually unlimited, but it may be confined due to the system resource limit. This means Network Gateway can handle multiple associations at the same time.

2.2.1.1.3 Asynchronous Nature

Asynchronous mode is not supported. All operations will be performed synchronously.

2.2.1.1.4 Implementation Identifying Information

The Implementation Version Name and the Implementation Class UID are as follows:

Implementation Version Name	INF_4.5
Implementation Class UID	1.2.410.200010.99.3.5

2.2.1.2 Association Initiation Policy

Network Gateway initiates a new association to transfer images only when the retrieve request is received. This association corresponds to only Real-World Activities.

2.2.1.2.1 Real-World Activity - Storage

2.2.1.2.1.1 Associated Real-World Activity

Network Gateway can transfer images to remote applications when responding to the retrieve request.

2.2.1.2.1.2 Proposed Presentation Contexts

Table 2-4: Presentation Context List – Proposed (Network Gateway)

2.2.1.2.1.2.1 SOP Specific Conformance for Instance Storage SOP Classes

This implementation can perform multiple C-STORE operations over a single association.

Upon receiving a C-STORE confirmation containing a Successful status, this implementation will perform the next C-STORE operation. The association will be maintained if possible.

Upon receiving a C-STORE confirmation containing an Error or a Refused status, this implementation will terminate the association. The current C-STORE operation is considered as failed.

Upon receiving a C-STORE confirmation containing a Warning status, this implementation will treat it as a Success response.

The following timers are related to the Image Storage SCU. These timers can be configured by editing “MFDCM38.PRO” configuration file. If any of these timers expires, the connection is closed and the operation is considered as failed.

Timer Name	Default (in sec.)	Meaning
ARTIM_TIMEOUT	90	The number of seconds to use as timeout waiting for association request or waiting for the peer to shut down an association.
ASSOC_REPLY_TIMEOUT	60	The number of seconds to wait for reply to associate request.
RELEASE_TIMEOUT	60	The number of seconds to wait for reply to associate response.
WRITE_TIMEOUT	60	The number of seconds to wait for a network write up to be accepted.
CONNECT_TIMEOUT	60	The number of seconds to wait for a network connection to be accepted.
INACTIVITY_TIMEOUT	60	The number of seconds to wait for data between TCP/IP packets.

Table 2-5: Timers for Network Gateway

When Network Gateway initiates an association to issue a C-STORE operation, the image will be transmitted with the same elements in which it was received.

2.3 Communication Profiles

2.3.1 Supported Communication Stacks

DICOM Upper Layer (Part 8) is supported using TCP/IP.

DICOM Secure Transport Connection Profiles (Part 15) is supported using The Basic TLS Secure Transport Connection Profile.

2.3.2 TCP/IP Stack

The TCP/IP stack is inherited from the Microsoft Windows Socket implementation.

2.3.2.1 API

Not Applicable

2.3.2.2 Physical Media Support

DICOM is indifferent to the physical medium over which TCP/IP executes (e.g. Ethernet, Fast-Ethernet, FDDI, ATM, etc)

2.3.3 Point-to-Point Stack

Not Applicable

2.3.4 Basic TLS Secure Transport Profile
